Title: Paints Containing Red Lead and a Rapid Method for Their Evaluation

Original Publication: Przem. chem., 1956, 12, No 1, 43-47

Abstract: Description of the properties of red lead (I) to which is attributed the inhibiting effect of coatings containing I, on progress of electrochemical corrosion of iron. New formulas of paints containing I have been developed. Content of I in the paints has been reduced from 85% to 51 and 34%, depending on the intended use of the paint. Procedures utilized heretofore for testing corrosion inhibiting paints, are characterized. The underlying principle of the proposed method of testing consists in carrying out determinations of the potential of a steel electrode, coated with the paint, as a function of time.

Card 1/2

Abst Journal: Referat Zhur - Khimiya, No 2, 1957, 6217

Abstract: There are described the apparatus, measuring procedure, preparation of the surfaces and painting of the steel electrodes. The electrode is in the shape of a rod. Evaluation of the results of tests is done on the basis of the curve showing change in potential values with time; very good anti-corrosion properties of the paints being characterized by a very rapid initial increase of the potential, for instance from -100 to 0 mv, after which the curve becomes horizontal. Good properties of the paints are characterized by a gradual increase of the potential, for instance from -200 to -100 mv, followed by a gradual and slight decrease thereof with time. Satisfactory properties are indicated by a rapid drop of potential which becomes stabilized, thereafter, at its lower value (for instance from -100 to -350 mv). Poor qualities are characterized by a low value of the potential, for example of -500 to -600 mv. An anomalous course is observed on use of passivating pigments soluble in water. Examination of changes in external appearance of the coatings helps in the interpretation of the results of potentiometric determinations.

Title : An Unusual Case of Acute Hydrogen Sulfide Poisoning in the Chemical Industry

Orig Pub: Pracovni lekar., 1956, Vol 8, No 2, 118-119 (in Czech)

Abstract: A severe case of H<sub>2</sub>S poisoning is described in which the the gas seeped in through a sewer. Among the symptoms observed were loss of consciousness, loss of pupillary reflexes, hoarseness, and foaming at the mouth; heart activity was not impaired. On the fourth day after the poisoning, the patient was in good condition, though symptoms of damage to the peripheral nervous system and the vestibular apparatus was observed, as well as dysarthritic speech, etc. The treatment is described. Complete recovery was attained after five months.

3224. THE FUNCTIONAL CAPACITY OF THE LIVER IN VARIOUS FORMS OF RHEUMATISM IN CHILDREN (Russian text) - Knopko A.I. - VOPR. REVMATIZMA (Novosibirsk) 1957 (262-268)

The carbohydrate metabolism of the liver, its detoxicating function and the formation of prothrombin in it were studied in 25 children with rheumatism (15 without circulatory disturbances, 5 with cardiovascular insufficiency of the 2nd or 2nd and 3rd degrees, and 5 with severe chorea). All the patients showed disturbance of the functional activity of the liver, mainly in respect of the antitoxic function and prothrombin-forming functions and to a small extent in the regulation of carbohydrate metabolism. These changes were especially evident during the active rheumatic phase with marked circulatory disturbances. Continuous observation showed that recovery of the disturbed liver function in rheumatism occurs slowly, and often even before discharge of the patient from hospital when the results of functional tests of the cardiovascular apparatus show absence of disturbance of the haemodynamics. For an impartial and objective evaluation of the condition of patients with rheumatism, investigation of the liver prior to discharge is advisable.

**TITLE:** Group Pushing (Scheduling) of Ovens (Grupповaya vydacha pechey)

**PERIODICAL:** Koks i Khimiya, 1958, Nr 5, pp 24 - 26 (USSR).

**ABSTRACT:** At the Works, Nr 3 (old) and Nr 4 (new) batteries were operated on the same schedule. Due to the above, the coke produced from Nr 3 battery was non-uniform, under-coked charges and stickers often occurred. This necessitated some rearrangement of the pushing schedule, namely, Nr 3 battery was divided into 8 groups of 6 ovens and Nr 4 battery into 7 groups of 9 ovens, with coking time of 16.0 and 14.0 hours, respectively. In the scheduling of ovens, their state was taken into consideration. It is stated that with the introduction of "group pushing", conditions of servicing the batteries and the quality of coke improved. Group scheduling of ovens is recommended for coke oven works operating batteries of various ages and degrees of wear. There are 6 tables.

ABSTRACT: The author considers the problem of evaluating the spectral density and spectral function of a homogeneous and isotropic Gaussian stray field. A formula is found for the asymptotically unbiased estimate of the spectral density and the behavior of this function is studied. The estimates derived in this paper have a somewhat different structure from the estimates derived by other authors for these same functions in the case of a stationary process and a homogeneous stray field. In conclusion the author thanks A. Ya. Dorogovtsev for assistance in solving this problem. Orig. art. has: 1 figure, 5 formulas.

J-25

Country : USSR  
Category: Soil Science. Mineral Fertilizers. J

Abs Jour: RZhBiol., No 18, 1958, No 82124

quality of agricultural production was increased with a sufficient amount of Mg and B in the soil, the mobility of microelements in the soil was changed, the harvest and quality of the hay of perennial grasses were raised. An excess of L was also harmful. A table shows the application of differential doses of L. New methods of amelioration of solonetz soils are reported; 'self-amelioration' or utilization of lower horizons of soil rich in lime and gypsum, addition of plain soil and other measures, and techniques of improvement of loose sands. -- B.D. TITLE: Ionic composition of the positive column of the glow discharge in inert gases at increased pressures

SOURCE: AN SSSR. Doklady, v. 168, no 2, 1966, 323-327

TOPIC TAGS: ion, complex ion, positive ion, glow discharge, glow discharge ion composition

ABSTRACT: The present paper communicates some results of glow discharge studies in inert gases with the addition of mercury vapor, in the pressure range of from 5 to 50 mm Hg. Measurement were made with the use of a mass spectrometer constructed especially for the research on ionic processes at high pressures, described before by the authors (Izv. AN UzSSR, 4, 59; 1963). Glow discharge in helium and in argon was studied. The partial pressure of mercury was in both cases approximately  $10^{-3}$  mm Hg. Helium underwent a preliminary purification by adsorption in liquid air cooled silica gel. Previous work by these writers (Doklady AN SSSR, 163, No.1, 155; 1955), has established the development of conditions favorable to the occurrence and stabilization of complex ions. These occurred at pressures over 5 mm Hg. At lower pressures, the complex ions

Card 1/2

UDC: 537.525

ACC NR: AP6015611

were, as a rule, not observed. Numerous results of the present research are discussed, with comments and interpretation of possible causes. The main point of interest is the discovery of a heavy complex ion, with a mass spectrometer record peak corresponding to mass number 404, and a 1% intensity relative to the  $Ar^+$  peak. This heavy ion was identified as the  $Hg^+$  molecular complex ion. A considerable content of ions with a mass number of 9 was also observed; this was interpreted as the  $He_2H^+$  complex ion. Orig. art. has 9 formulas.

TITLE: Mass-spectrometric investigation of the anode parts of increased-pressure hydrogen glow discharge

SOURCE: AN UzSSR. Izvestiya. Seriya fiziko-matemeticheskikh nauk, no. 3, 1966, 49-53

TOPIC TAGS: gas discharge plasma, glow discharge, gas discharge spectroscopy, electric discharge ionization, hydrogen ion, electron recombination

ABSTRACT: To check on the efficiency of formation of heavy ion clusters in a gas-discharge plasma at pressures higher than used by other workers (0.1 - 1.0 mm Hg), the authors investigated the ions drawn out from the anode region of hydrogen discharge at pressures 5 - 18 mm Hg. The apparatus was described earlier (Izv. AN UzSSR, seriya fiz.-mat. nauk 1963, no. 4, p. 59). The ions were extracted through an opening in the anode (extraction channel 75  $\mu$  dia, 70  $\mu$  long). No stable ion current could be produced at pressures higher than 18 mm Hg. The obtained plot of the total ion current against pressure exhibited a periodic variation indicating that the glow discharge was stratified and that the strata moved relative to the anode with change in pressure. The measurements show that the most intense component of the current is due to  $H_3^+$  at all pressures.  $H_1^+$ ,  $H_2^+$ , and ions with masses 4 and 5 were also observed. The mass-5 cluster is positively identified as  $H_5^+$ , while the ion with mass 4 is identified as

$H_2D^+$ , but only tentatively, in view of its very low content. Plots of the various components against pressure and discharge current are presented and interpreted. The most favorable conditions for the formation of  $H_2^+$  lie in the pressure range 5 - 9 mm Hg. The near-hyperbolic decrease of the  $H_2^+$  component with increasing discharge current is evidence of effective recombination with electrons in the discharge. TITLE: A signalling pickup. Class 74, No. 190236 (announced by the Institute of Automation and Telemechanics [Technical Cybernetics] [Institut avtomatiki i teleme-khaniki (tekhnicheskoy kibernetiki)])

SOURCE: Izobreteniya, promyshlennyye obrasty, tovarnyye znaki, no. 1, 1967, 146

TOPIC TAGS: signal element, remote control, electric equipment

ABSTRACT: This Author's Certificate introduces: 1. A signalling pickup which contains a sensitive element, lever transmission and force compensation unit. To provide a wider range of applications, the unit is equipped with two adjustable-tension springs and a double null indicator. The output circuit of the force compensation unit is connected to a secondary measuring device. 2. A modification of this pickup with independent control of the null indicators. One of the springs is connected to an auxiliary lever which is pressed against a stop by a second spring fastened to the pickup frame. The power lever acts against a lug on the auxiliary lever to move it away from the stop.

TITLE: Isothiocyanates (XIV). Preparation and properties of some substituted  
benzylisothiocyanates

SOURCE: Chemicks vestn, no. 5, 1965, 353-359

TOPIC TAGS: isocyanate, thiocyanate, IR spectrum, IR spectroscopy, spectrophotometric analysis, substituent

ABSTRACT: [Authors' English summary modified]: Synthesis of m- and p- substituted benzylisothiocyanates is described. Because the amines of the starting materials are sensitive to atmospheric carbon dioxide, the reaction must be conducted in a nitrogen atmosphere. The reaction medium is maintained slightly alkaline, and the amine is liberated by stepwise addition of a solution of NaOH. Spectrophotometric study of the reaction in ultraviolet light shows that the reactivity of various benzyl-

12

isothiocyanates differs only slightly when glycine is added to their solutions. The infrared spectra of the synthesized benzyl-isothiocyanates in the region of 2000 to 2200  $\text{cm}^{-1}$  show that the values of  $\nu_{\text{asym}}$  NCS agree well with the sigma sub 1 values of the individual substituents. <sup>42153</sup> Docent La. Drobná and Engineer J. Augustin are thanked for their advice and help in the kinetic measurements. Graduate chemist E. Solcaniova is thanked for measuring the infrared spectra." Title : Utilization of Coal-Hydrogenation Waste to Increase Production of City Gas During Periods of Peak Consumption.

Orig Pub : Paliva, 1957, 37, No 9, 301-306

Abstract : To determine the possibility of increasing production of city gas by means of an addition to gas-oven charge of tarry waste of coal hydrogenation, full-scale experimental runs were carried out in one chamber of a Didier type oven which was equipped with separate condensation unit. It is shown that optimal addition of waste amounts to 6-8% by weight of the charge, which resulted in an 11% increase of the gas yield with an increase of

TOPIC TAGS: metal surface, adsorption, adhesion

ABSTRACT: Contact between the molecules of a gas and a metal surface can result either in a rebound of the gas molecule or in its adsorption on the metal surface. The factors influencing this mechanism are the geometry of the molecules and the relationship between the electronic structure of the molecules. A Table showing activities of certain metals towards some gases is shown. The mechanism of the adsorption is discussed and equations used for the derivation of the accommodation coefficients of the gases on metal surfaces are presented. Determination of the coefficient of adhesion is described. Experimental methods for the evaluation of the adsorption coefficient are evaluated. The coefficient of the probability of gas adhesion is discussed. Mutual relationship between the coefficients that were discussed are evaluated. Orig. art. has: 7 figures, 21 formulas and 5 tables. Floating flexible vessels for the transportation of petroleum products; problems of durability and hydrodynamics, and theory and methods of calculation (Plavuchiye elastichnyye yemosti dlya transportirovki nefteproduktov; voprosy prochnosti i gidrodinamiki, teoriya i metody rascheta) Leningrad, Izd-vo "Sudostroyeniye", 1969. 223 p. illus., biblio. 1,250 copies printed

TOPIC TAGS: ocean transportation, inland vessel data, merchant vessel data, cargo ship, solid statics, hydrodynamics

PURPOSE AND COVERAGE: The book presents the results of investigations of the strength and speed of new means of transportation--floating elastic vessels intended for the transportation of petroleum products and other liquid loads on sea and inland waterways. Experience and design of manufacture of such vessels, accumulated in Soviet and foreign shipbuilding is described. Practical methods for calculating the strength and speed of floating elastic vessels under all principal operating conditions are given. Recommendations on the design and construction of such vessels are presented. The bulk of the investigations reported were made by the authors and are published for the first time. The book is intended for engineering-technical workers in design offices and in the shipbuilding industry, and can also be used by students of shipbuilding institutes and faculties. Authors thank N. P. Sytov, A. L. Koshevoy, B. I.
